#### Haematology Issues in Orthopaedics Pre-operative management of the emergency orthopaedic patient B.S.O.A Spring Meeting 2016

Dr Ben Clevenger FRCA

Preoperative intravenous iron to treat anaemia in major surgery

# Haematology Issues in Orthopaedics

- Anaemia and transfusion
- Recent guidance
- Patient blood management
  - Diagnosis and treatment of anaemia
  - Reducing blood loss
  - Managing anaemia / transfusion decisions
- Anticoagulation and antiplatelet agents

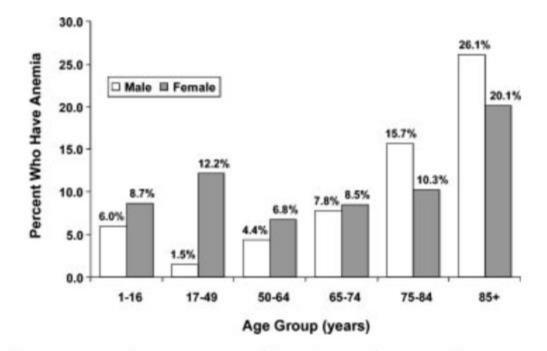

# Anaemia

- Insufficient circulating red cell mass or haemoglobin concentration
  - Hb <130 g/L men
  - Hb <120 g/L women

# **Prevalence of anaemia**

Data from third National Health and Examination Survey 1988 -1994 (USA)

# Aetiology

- Iron deficiency most common
  - Absolute iron deficiency
  - Anaemia of chronic disease is a state of functional iron deficiency
  - Hepcidin regulates iron metabolism

# Multimorbidity and increasing age

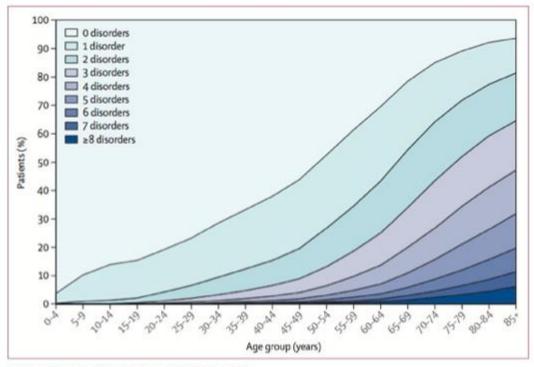

Figure 1: Number of chronic disorders by age-group

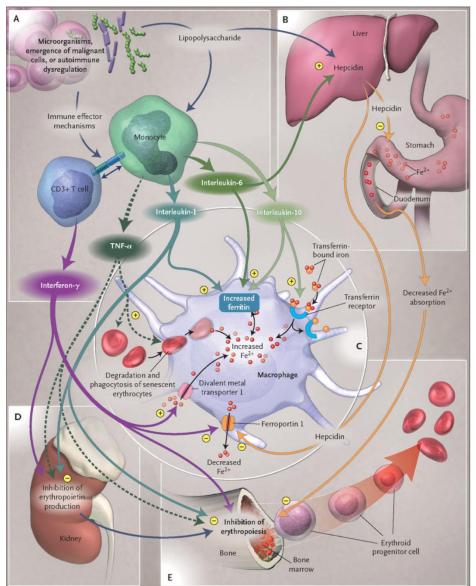

## Iron and inflammation

Inflammation

Reduced free iron

Reduced EPO

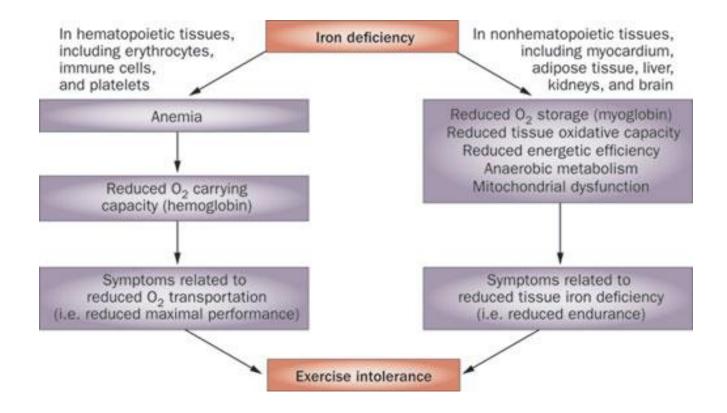

Failure of Absorption

Reduced Erythropoiesis

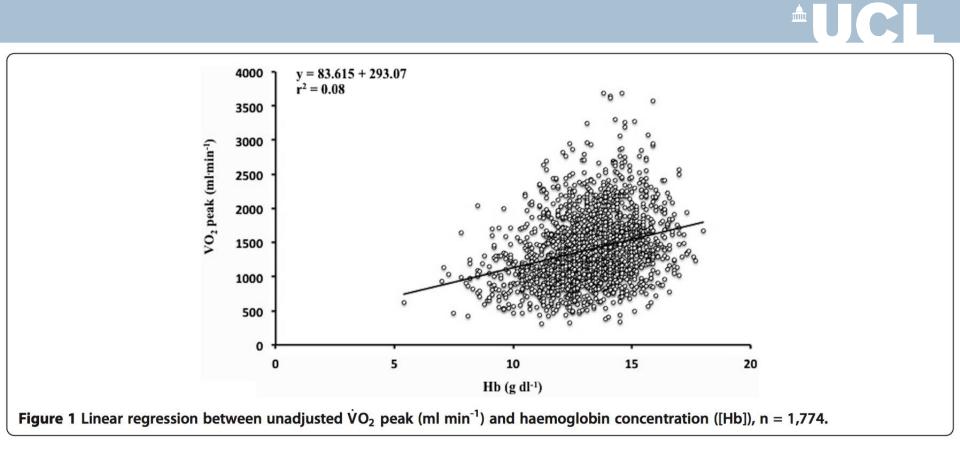

Weiss, G. & Goodnough, L.T., 2005. NEJM, 352(10), pp.1011–1023.

# **Anaemia and Exercise Capacity**

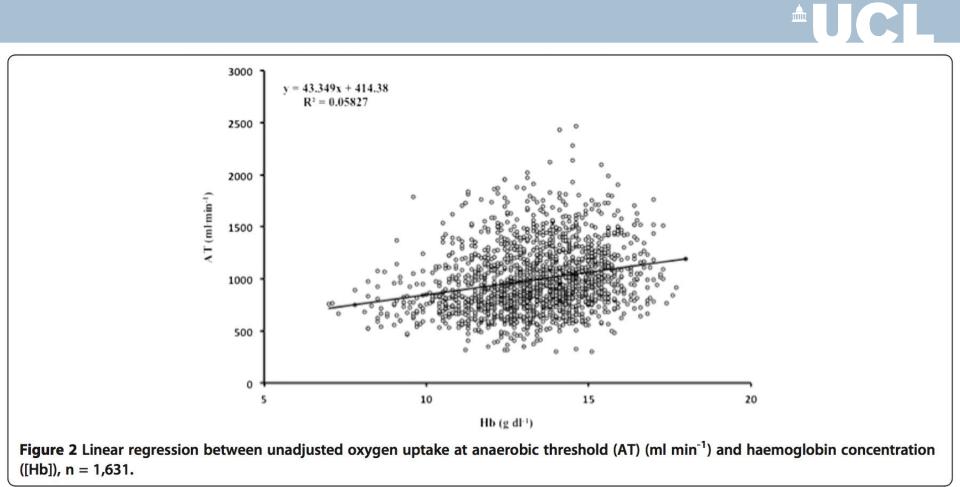

van Veldhuisen, D. J. et al. Nat. Rev. Cardiol. 2011

- Reduced VO2 and AT known to be associated with adverse outcomes
- Anaemia associated with reduced VO2 peak and exercise performance

1774 preoperative patients

Anaemia associated with reduced AT

Systematic review

### Meta-analysis of the association between preoperative anaemia and mortality after surgery

A. J. Fowler<sup>1</sup>, T. Ahmad<sup>1</sup>, M. K. Phull<sup>2</sup>, S. Allard<sup>3</sup>, M. A. Gillies<sup>4</sup> and R. M. Pearse<sup>1</sup>

#### 949445 patients

371594 patients (39.1%) anaemic

#### Increased mortality Odds Ratio 2.90

Fig. 2 Forest plot showing composite outcome of 30-day or in-hospital mortality after surgery, according to author-defined anaemia. Sizes of markers indicate weight for each study according to sample size. A Mantel-Haenszel random-effects model was used for meta-analysis. Odds ratios are shown with 95 per cent c.i.

# **Anaemia and Fractured neck of femur**

- Approximately 40% of #NOF patients are anaemic on admission
  - Chronic anaemia
  - Malnutrition
  - Haemorrhage from #
  - latrogenic haemodilution
- 25 g/L drop in Hb during perioperative period
- Majority of patients may be anaemic post-op

# **Triad of risk**

Major bleeding

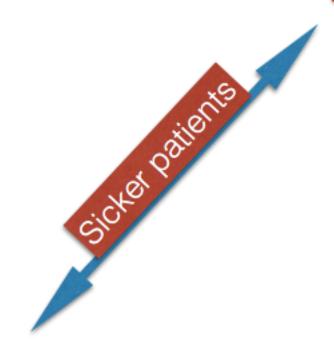

**Blood transfusion** 

# **Triad of risk**

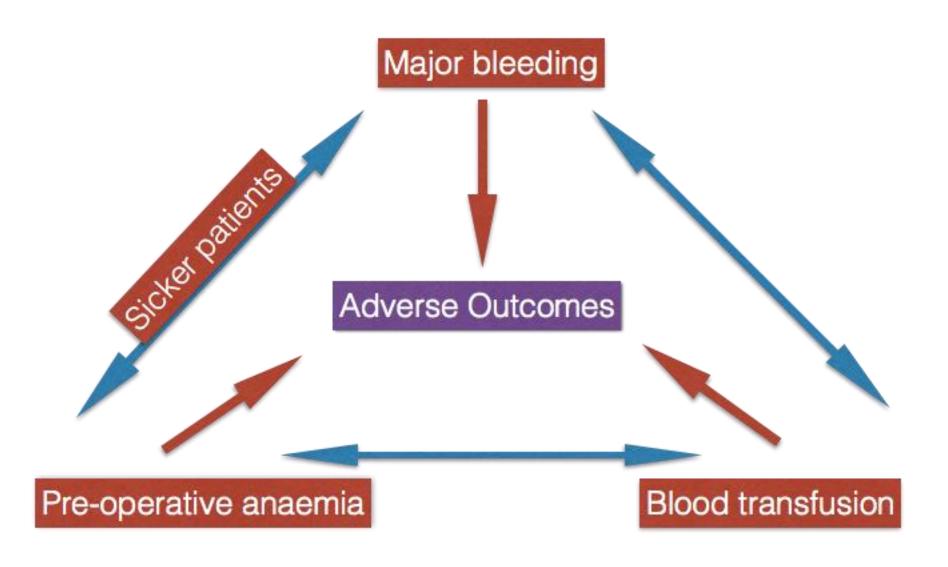

#### Major bleeding

Pre-operative anaemia

**Blood transfusion** 

# **Anaemia and Transfusion**

• Pre-operative anaemia is a significant risk factor for perioperative blood transfusion.

## How do we modify these risks?

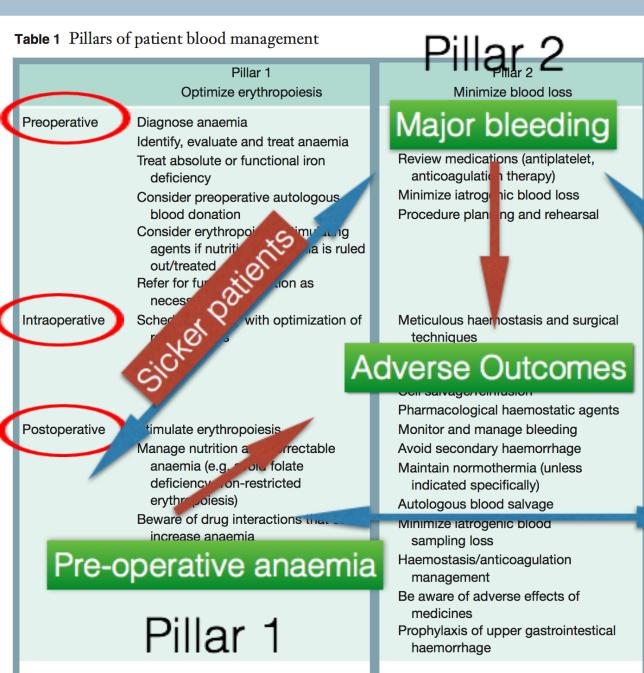

# Patient Blood Management

- An evidence based approach to reduce the risk from anaemia and blood transfusion
- Three pillars of care in surgical patients:
  - the detection and treatment of preoperative anaemia
  - reduction of perioperative blood loss
  - Managing anaemia (including restrictive haemoglobin transfusion thresholds)

#### Pillar 3 Manage anaemia

Compare estimated blood loss with patient-specific tolerable blood loss Assess and optimize patient's physiological reserve, e.g. pulmonary and cardiac function

Formulate patient-specific management plan using appropriate blood-conservation nodalities

Optimize cardies output Optimize oxygenation and ventilation Evidence-based transfusion thresholds

Maxize oxygen delivery Minim. Doxygen consumption Avoid/treat in actions promptly Evidence-based consfusion thresholds

#### Blood transfusion

Pillar 3

# **NICE Transfusion 2015**

#### Transfusion

**Blood transfusion** 

NICE guideline NG24 Methods, evidence and recommendations November 2015

Final version

Commissioned by the National Institute for Health and Care Excellence

https://www.nice.org.uk/ guidance/ng24

| Summary of NICE Guidelines: Blood T                           | ransfusion  |
|---|---|
| Alternatives to blood transfusion for patients having surgery | Offer oral iron in iron deficiency before and after surgery.<br>Offer tranexamic acid in surgery expected to have>500ml blood loss.<br>Consider cell salvage with tranexamic acid if high volume blood loss expected  |
| Red blood cells   | Consider a threshold of 70g/L and a target of 70-90g/L after transfusion when using restrictive red blood cell transfusions.<br>Consider single-unit red blood cell transfusions for adults who do not have active bleeding.  |
| Platelets   | <ul> <li>In patients not bleeding or not having an invasive procedure or surgery:</li> <li>Offer prophylactic platelets with platelet count below 10x10<sup>9</sup>/L and who do not have</li> <li>Chronic bone marrow failure</li> <li>Autoimmune thrombocytopenia</li> <li>Heparin-induced thrombocytopenia</li> <li>Thrombotic thrombocytopenic purpura</li> <li>Do not routinely transfuse more than a single dose of platelets.</li> </ul> |
| Fresh Frozen Plasma (FFP)                                     | <ul> <li>Only consider FFP with clinically significant bleeding if coagulation tests are abnormal e.g Prothrombin time ratio, Activated partial thromboplastin time ratio &gt;1.5</li> <li>Do not offer FFP to correct abnormalities in coagulation in patients who:</li> <li>are not bleeding (unless having a procedure with a risk of significant bleeding)</li> <li>Require reversal of vitamin K antagonist</li> </ul>                     |
| Prothrombin Complex Concentrate (PCC)                         | <ul> <li>Offer immediate PCC for the emergency reversal of warfarin anticoagulation in:</li> <li>severe bleeding or</li> <li>head injury with suspected intracerebral haemorrhage</li> </ul>  |
| Cryoprecipitate   | Consider cryoprecipitate for patients with clinically significant bleeding and fibrinogen <1.5g/L<br>Consider prophylactic cryoprecipitate for patients with fibrinogen level <1.0g/L who are having invasive<br>procedures or surgery with a risk of bleeding.<br>Use 2 pools of cryoprecipitate and reassess the clinical condition   |
| Patient Safety  | Monitor for acute blood transfusion reactions<br>Consider using electronic identification systems to improve safety and efficiency during the blood transfusion<br>process  |
| Patient information   | <ul> <li>Provide verbal and written information to patients who may have a transfusion explaining:</li> <li>the reason for transfusion</li> <li>the risks and benefits</li> </ul>   |

Ng et al, Cochrane Database of systematic reviews, 2015

# Pre or Peri-operative Iron for #NOF TRANSFUSION PRACTICE

# Role of perioperative intravenous iron therapy in elderly hip fracture patients: a single-center randomized controlled trial

José Antonio Serrano-Trenas, Pilar Font Ugalde, Laura Muñoz Cabello, Luis Castro Chofles, Pilar Serrano Lázaro, and Pedro Carpintero Benítez

- Standard treatment vs Iron Sucrose (200mg IV x3 doses from day of admission)
- Transfusion rates were primary outcome

# **Pre or Peri-operative Iron for #NOF**

- Transfusion rates:
  - Standard care 41.3% vs IV Iron 33.3% of patients (not significant)
  - Only significant differences found in patients with higher pre-op Hb (>120 g/L) and intracapsular fractures

#### www.cochranelibrary.com

#### **Pre-operative assessment of bleeding risk**

- Bleeding history
- Past medical history, drug history
- Must balance risk of bleeding with risk of thrombosis
- Vitamin K antagonists
  - Warfarin
- Novel oral anticoagulants
  - Direct factor Xa inhibitors: rivaroxaban, apixaban
  - Direct thrombin inhibitor: dabigatran
- Antiplatelet agents

## **Pre-operative Planning**

- Assess need for anticoagulation to be interrupted for surgery
- Determine whether patient is standard risk or high risk of thrombosis
  - Recent VTE (3 months), recent stroke (6 months), recent coronary stent
  - Whether very high bleeding risk?
- Consideration of bridging anticoagulation

#### Non-vitamin K Oral Anticoagulants (NOACs)

- Increasing use as alternatives to warfarin
  - Especially patients with poor control
  - Laboratory monitoring not required
- Dabigatran direct thrombin inhibitor
- Apixaban, Rivaroxaban factor Xa inhibitors
- New challenges when managing patients for surgery

#### Non-vitamin K Oral Anticoagulants (NOACs)

- Lack of specific antidotes
- Coagulation monitoring non-specific
- Significantly lower rates of intracranial haemorrhage compared to warfarin

|                               | Rivaroxaban            | Apixaban               | Dabigatran                   |
|-------------------------------|------------------------|------------------------|------------------------------|
| Mechanism of action           | Factor Xa<br>inhibitor | Factor Xa<br>inhibitor | Direct thrombin<br>inhibitor |
| Dosing frequency              | Once daily             | Twice daily            | Twice daily                  |
| Half-life (h)                 | 5-13                   | 12                     | 8-15                         |
| Bioavailability (%)           | 80                     | 66                     | 6.5                          |
| Renal clearance (%)           | 66                     | 25                     | 80                           |
| Plasma protein<br>binding (%) | > 90                   | 87                     | 35                           |

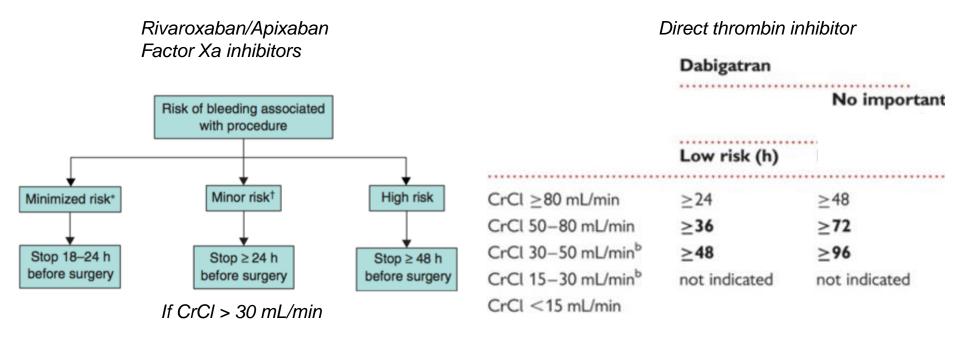

## **Key Management Points for NOACs**

- Time of last dose of NOAC
- Current renal function
- Planned procedure

## **NOACs in Elective Surgery**

- No need for bridging
- European Heart Rhythm Association (EHRA) guidelines 2013 for stopping pre-op:

## **Perioperative management of NOACs**

- Stop NOAC
- Perform specific coagulation tests and interpret according to NOAC being taken
- Aim to defer surgery for 12 hours, ideally 24 hours
  - Activated charcoal if ingestion <2 hours</li>
- Vitamin K / FFP have no effect
- If severe life threatening bleeding:
   PCC 25-50 units/kg
  - Haemodialysis for dabigatran

#### **Neuraxial anaesthesia and anticoagulants**

Table 1 Recommendations related to drugs used to modify coagulation. Recommended minimum times are based in most circumstances on time to peak drug effect + (elimination half-life  $\times$  2), after which time < ¼ of the peak drug level will be present. For those drugs whose actions are unrelated to plasma levels, this calculation is not relevant. Data used to populate this Table are derived from ASRA and ESRA guidelines [1, 2] and information provided by drug manufacturers. These recommendations relate primarily to neuraxial blocks and to patients with normal renal function except where indicated.

| Drug                                  | Time to<br>peak effect | Elimination<br>half-life | Acceptable time after<br>drug for block<br>performance | Administration<br>of drug while<br>spinal or epidural<br>catheter in place <sup>1</sup> | Acceptable<br>time after block<br>performance<br>or catheter<br>removal for<br>next drug dose |

## **Restarting NOACs after surgery**

## **Clopidogrel and #NOF**

- Clopidogrel
  - ADP receptor blocker on platelet membrane
  - Irreversibly blocks platelet aggregation
  - 7 days until production of new platelets for reversal
  - Discontinuation recommended for 7 days before elective surgery and neuraxial anaesthesia
- Robust evidence for early intervention in these patients
  - Higher risk of operative morbidity and mortality contributed to by delaying surgery

## **Clopidogrel and #NOF**

- Most recommendations are to avoid spinal for 7 days
- However, spinal anaesthesia is used
  - 40% of patients on clopidogrel in one series
  - Authors conclude:
  - In balance general anaesthesia is safe but spinal anaesthesia can be considered if all the risks are explained to the patient before the procedure.

### **Anaesthetic management**

- Regional anaesthesia
  - Spinal and epidural anaesthesia significantly decrease estimated blood loss compared with @A^orscombined-435 GA-epidural
- Maintain normothermia
  - 1°c decrease in temperature =<sup>R</sup>¶®%<sup>a</sup>Infcréaise<sup>x</sup>, infbløbd<sup>-77</sup> loss
- pH correction
- Maintain Calcium concentration >1mmol/l
- Fluid balance

### **Tranexamic acid**

#### Anti-fibrinolytic use for minimising perioperative allogeneic blood transfusion (Review)

Henry DA, Carless PA, Moxey AJ, O'Connell D, Stokes BJ, Fergusson DA, Ker K

"effective in reducing blood loss during and after surgery, and appear to be free of serious adverse effects."

Henry, D.A. et al., 2011. The Cochrane database of systematic reviews, (3), p.CD001886.

- Lysine analogue
- Reversibly inhibits fibrinolysis
- Meta-analysis suggests reduction of surgical blood loss by about onethird.
- 1g (approx. 14 mg/kg) sufficient for most adults

Ker et al., Br J Surg 2013;100(10);1271-1279

### **Tranexamic Acid**

Effects of tranexamic acid on death, vascular occlusive events, and blood transfusion in trauma patients with significant haemorrhage (CRASH-2): a randomised, placebo-controlled trial

CRASH-2 trial collaborators\*

#### Cell salvage for minimising perioperative allogeneic blood transfusion (Review)

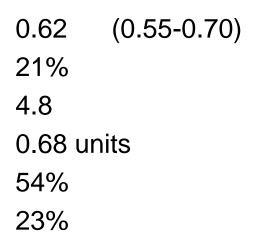

Carless PA, Henry DA, Moxey AJ, O'Connell D, Brown T, Fergusson DA

## Cell Salvage

- 75 trials (n=6025)
- Overall
  - Reduction in blood transfusion
    - ARR
    - NNT
  - Allogenic Transfusion saving
    - Greatest in orthopaedics
    - Cardiac

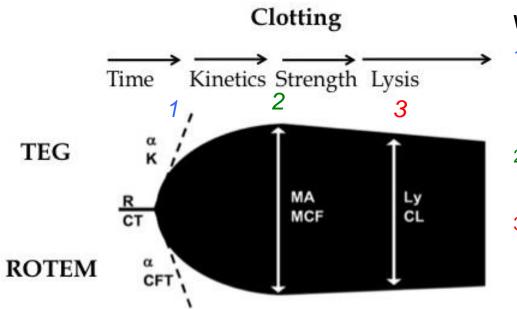

## **Point of Care Testing**

- Laboratory coagulation tests
  - Turn around time
  - Delay in obtaining results
  - Empirical treatment
- Point of care tests
  - Rapid result reporting
  - Goal directed management of coagulopathy
  - Reduce empirical treatment

#### **TEG / ROTEM**

#### What do we need to know?

- 1. Is clot forming and how rapidly?
  - Clotting factor levels and anticoagulants
- 2. How strong is the clot?
  - Platelets and fibrinogen
- 3. Is it stable?
  - Fibrinolysis

TEG – Thromboelastography ROTEM – Rotational Thromboelastometry

### **Perioperative management**

- Point of care based management algorithms
- Algorithms for perioperative bleeding
  - Predefined transfusion triggers to guide haemostatic interventions
- Restrictive transfusion triggers
- Single unit transfusions

### **Trauma and major bleeding**

- NICE Trauma guidelines February 2016
- British Society of Haematology major haemorrhage guidelines – July 2015

## GUIDELINES FOR THE PROVISION OF anaesthetic services

#### **Chapter 5. Emergency anaesthetic services**

- 2.27 Near-patient testing for haemoglobin, blood gases, lactate, blood sugar and ketones should be readily available for theatres.
- 2.28 Near-patient testing for coagulopathy should be considered, particularly in areas where major blood loss is likely...
- 2.34 Availability of a cell salvage system should be considered for procedures associated with blood loss exceeding 1.5 litres.

#### **Trauma and major bleeding**

- Have a defined major haemorrhage protocol
- Damage control resuscitation for active bleeding
- Early haemorrhage control
- Permissive hypotension, use RBCs and FFP 1:1
- Early tranexamic acid
- Monitor by point-of-care and/or laboratory tests
- FFP if INR > 1.5
- Cryoprecipitate if fibrinogen < 1.5 g.l<sup>1</sup>
- Platelets if platelet count <  $75 \times 10^9$ . I<sup>1</sup>

## Conclusion

- Triad of risk: blood transfusion, major bleeding and anaemia significant in orthopaedics
- Patient blood management can improve outcomes in both elective and emergency surgery
- Requires organisational support and planning
- Increasingly robust guideline frameworks to aid implementation

## Thank you
